

World Outlook Energy 2015

★ ★ ★ ★

Big questions abound in global energy in 2015:

- Could **oil prices** stay lower for longer? What would it take for this to happen and what would it mean for energy security and for the energy transition?
- **India** is set for a period of rapid, sustained growth in energy demand: how could this re-shape the energy scene?
- What do new **climate pledges** mean for the way that the world meets its rising needs for energy?
- What are the implications of the rising coverage of **energy efficiency** policies and the growing competitiveness of **renewables**?
- Is the **unconventional gas revolution** going to go global or to remain a North American phenomenon?

These issues – and many more – are discussed here, with a special focus on India accompanying the customary, in-depth *WEO* analysis of the prospects for all fossil fuels, renewables, the power sector and energy efficiency around the world to 2040.
